Design

§ The High Definition Three Mirror 10mm Lens provides mirrors for the examination of the fundus and the anterior chamber angle.

§ Three mirrors of 64°, 67° and 73° are arranged at 120° intervals.

§ The small 64° mirror is inclined for gonioscopic procedures. It may also be used for the observation of the vitreous and the fundus near the ora serrata.

§ The middle size mirror is inclined at 67° to observe the peripheral fundus from the ora serrata to the region of the equator.

§ The largest mirror is inclined at 73° to observe the fundus from the equator to an area adjacent to the posterior pole.

§ The posterior pole can be observed through the central axis of the lens.

§ A small diameter contact surface for use without methylcellulose.

§ The contact diameter of the OG3MHD-10 can be increased by attaching either the OACF-15(15 mm flange diameter) or the OACF-17(17mm flange diameter) for extra lens stability and laser procedures.

§ Laserlight® HD anti-reflective coating for maximum light transmission and image brightness.
